ABOUT US

The power to make a difference

Power, temperature control and energy services
Human needs are the same all over the world, but power supply isn’t. By bridging the gap we have a critical role to play – something that inspires and challenges us every single day.

We may be the global leader in providing mobile, modular power, heating, cooling and energy services, but we’re always looking to do more for the business communities and people we work with. We treat every project like it’s our first. For us, every day is a new beginning.

We’re driven by four beliefs:

Dynamic
Using our entrepreneurial passion to deliver and help you make great things happen.

Expert
Using our blend of experience, expertise and planning to keep us – and you – ahead of the game.

Innovative
Learning from the world for a better today – and to make great leaps tomorrow.

Together
Asking the best of each other; harnessing our scale and diverse skills to grow stronger.
Powering progression

Reliable power, temperature control and energy services are easy to take for granted, but getting them right is absolutely vital.

They enable children to study, hospitals to give vital care, businesses to grow and global events to shine. It can often be the difference between success and failure - or even life and death.

But in many places we work there isn’t the necessary amount, or suitable type available to make things run efficiently and reliably. Fortunately, our family of more than 7,000 people across the world are expert, committed and passionate about what they do - helping people, businesses and entire communities get where they need to. It's a responsibility we don't take lightly.

Our products

The products we use are much more than big boxes - they power cities, they cool rockets and help communities thrive. For projects both big and small, we’ve got the tools for the job.

FROM LOCAL NEEDS

From short term power for local events, businesses or emergency situations.

TO NATIONAL INFRASTRUCTURE

...to multi-megawatt power plants that provide supplemental power to whole countries.

Power

Whether you are seeking a multi-megawatt, renewable power plant while a permanent grid is established, or a small entertainment company wants to put on a local show with the help of reliable rental power and a battery powered contingency plan, we have the flexibility and experience to get the job done.

Energy Storage and Services

The energy market is undergoing a significant transition and renewable energy is playing a big part in this transformation. We are focused on delivering cost-effective, flexible and greener solutions across the globe, and our smart energy management can make a big impact. We have intuitive software that allows us to deliver the most efficient, clean power, with each piece of equipment synchronised to enhance operations. Our hybrid solutions and battery storage can give our customers the answers they are looking for in this era of digitalisation.

Heating and cooling

When it comes to temperature control, we’re the ones you want on your team. Because we’re also experts in providing stable, ambient temperatures for all types of industry and circumstance - essential for healthy working conditions - and to enable operations to run safely.
Experts in your business

We’ve been lucky to work with a broad range of industries over the years – helping us to evolve, learn and grow along the way.

These experiences mean we’re now able to bring optimal, cost-effective and reliable options to customers, however unique, urgent or extreme the job. We’ve also developed our offering to suit the needs of different sectors – and have the largest, best-in-class fleet in the world.

But it’s not just our equipment or size that makes us different. Our people are second to none. They’re passionate to be the best and get things done, with expert know-how and attention to detail.

Some things are the same regardless of sector, and some are unique. But whatever your business you can always rely on us to provide the solution you need – when you need it.

We like to think of ourselves as being on your team, partners, helping and supporting you, from initial discussion to the moment we leave your site after a successful project.

The sectors we help

- Agriculture
- Construction
- Contracting
- Data centres
- Events
- Facilities management
- Food and beverage
- Government
- Manufacturing
- Mining
- Oil and gas
- Petrochemical and refining
- Pharmaceuticals
- Renewable energy
- Shipping
- Telecommunication
- Utilities
Collaborative working and lasting partnerships

We make it easy for you

We offer expert support when your business needs it most – no matter how remote or challenging your location.

Our services are designed to help things go exactly to plan. From making sure you’ve got peace of mind with detailed contingency planning should your needs change, to remote monitoring so you can be sure our equipment will always work just the way it should. We’ve got everything covered.

Our tailored services

- Contingency planning
- Emergency response
- Fuel management
- HCFC phaseout
- High-voltage power
- Power plants
- Remote monitoring
- Energy management
- Renewables integration
Benefits of working with Aggreko

**Rapid response**
Equipment is available at short notice and can be delivered and installed rapidly to meet your needs.

**Turn-key service**
Our specialist services include everything from initial assessment of needs to service backup.

**No CAPEX**
Renting equipment eliminates the need for capital expenditure when purchasing equipment. It incurs no large down payments or interest costs and preserves your borrowing capacity.

**Guaranteed reliability**
Built-in redundancy and on-site technicians mean that you can rest assured that the power supplied by our power plants is reliable and will run 24/7 if needed.

**Reduced risk**
We train our teams and maintain our equipment to the highest standards, reducing your exposure to any associated risks.

**Fuel flexible**
We are fuel flexible, and have power generators that can run on diesel, (gas including natural gas CNG, LNG, APG and LPG), heavy fuel oil (HFO) and solar thermal hybrid.

**Flexible capacity**
The installed capacity of our power packages can be increased or decreased as required. Equipment is available on a short or long-term basis, depending on your power and temperature control needs.

**Commercial flexibility**
Need to increase or decrease how many generators are required during the contract? No problem. Need flexible commercial terms? No problem. We can work with you to agree flexible terms that make us both happy.
Global reach, local expertise

We may work all over the world, but it’s our local expertise that really counts. With service centres and offices in 193 locations, you can be sure we’ll be there when you need us.
From the people we hire, to our training, our can-do attitude and attention to detail – we do things with a passion that sets us apart.
Greener, cleaner energy: The future is now

The energy market is undergoing significant transition, fuelled by the key trend of decarbonisation.

We’re working at the forefront of this rapidly changing energy industry and we’re committed to working with you to overcome your challenges. Our reliable, cost-effective, and flexible solutions and our 50+ years of experience are the dependable partner your project is looking for.

Our ongoing investment in developing technology is positioning us to be in the best place to make great strides forward in cleaner energy. Our hybrid solutions, consisting of thermal or renewable power generation, energy storage and smart energy management, provide you with the reliability you need, and help you meet reduced emissions regulations.

Our equipment is integrated and managed by our proprietary software, which efficiently balances each separate power source and synchronises them to bring you a seamless and clean power supply. All of our equipment is housed within our modular, standardised containers too, and these features are designed so we can adapt to fulfil any customer requirement.

Smarter technology: we are investing in new, efficient and cleaner technology.

Our wide range of products sit at the heart of what we do each day and are deployed in different configurations, providing power, heating, cooling, or to support a wide range of applications.

The data we collect from our connected assets is used to respond quicker to issues, predict future problems and, ultimately, design and build products more suited to our customers’ changing energy needs. We’re using data to pass the benefits down to our customers.

We’re adding more efficient and cleaner thermal generation, waste-heat recovery, combination of conventional and renewable components and smart energy storage, including a 1 MW solar power pack, to our offering. We are also lending our experience to prospective wind farm projects, with our portable equipment perfect for offshore platforms.

This ensures we remain at the spearhead of the energy market and we can continue to adapt to any customer demands. No two projects are the same, and with our focus on innovation, we can be in the best place to react and deliver the best possible solution round the world.
The future is something we head into confidently, but with a drive to do more. We recognise that the needs of the customers, communities and industries we serve evolve constantly—meaning we have to, also. And with the need to discover ways of providing cleaner, more efficient energy more important than ever, we know what our responsibilities are. The challenge is set.
